Chapter 18. The Lognormal Distribution

Chapter 18. The Lognormal Distribution

§ 18.1 The normal distribution

§ 18.2 The lognormal distribution

§ 18.3 A lognormal model of stock prices

§ 18.4 Lognormal probability calculations

§ 18.5 Problems

Chapter 18. The Lognormal Distribution

§ 18.1 The normal distribution

§ 18.2 The lognormal distribution

§ 18.3 A lognormal model of stock prices

§ 18.4 Lognormal probability calculations

§ 18.5 Problems

Theorem 18.4-1

$$\mathbb{P}(S_t < K) = N(-d_2) \quad \text{with} \quad d_2 = \frac{\ln(S/K) + (r - \delta - \frac{1}{2}\sigma^2)T}{\sigma\sqrt{T}}.$$

Or equivalently, $\mathbb{P}(S_t > K) = N(d_2)$.

Theorem 18.4-2 The $(1 - p) \times 100\%$ prediction interval for S_t is (S_t^L, S_t^U) with

$$S_t^L = S_0 e^{(\alpha - \delta - \frac{1}{2}\sigma^2)t + \sigma\sqrt{t} N^{-1}(p/2)}$$

$$S_t^U = S_0 e^{(\alpha - \delta - \frac{1}{2}\sigma^2)t + \sigma\sqrt{t} N^{-1}(1-p/2)}$$

Go over Examples 18.6 and 18.7 on P. 558-559.

Theorem 18.4-3 It holds that

$$\mathbb{E}(S_t | S_t < K) = S_0 e^{(\alpha - \delta)t} \frac{N(-d_1)}{N(-d_2)}$$

$$\mathbb{E}(S_t | S_t > K) = S_0 e^{(\alpha - \delta)t} \frac{N(+d_1)}{N(+d_2)}$$

where recall that

$$d_1 = \frac{\ln(S/K) + (r - \delta + \frac{1}{2}\sigma^2)T}{\sigma\sqrt{T}} \quad \text{and} \quad d_2 = \frac{\ln(S/K) + (r - \delta - \frac{1}{2}\sigma^2)T}{\sigma\sqrt{T}}$$

Now we are ready to derive the Black-Scholes formula:

$$\begin{aligned}C(S, K, \sigma, r, t, \delta) &= e^{-rt} \mathbb{E} ([S_t - K] 1_{\{S_t > K\}}) \\&= e^{-rt} \mathbb{E} ([S_t - K] | S_t > K) \mathbb{P}(S_t > K) \\&= e^{-rt} \mathbb{E} (S_t | S_t > K) \mathbb{P}(S_t > K) + e^{-rt} \mathbb{E} (K | S_t > K) \mathbb{P}(S_t > K) \\&= e^{-rt} \mathbb{E} (S_t | S_t > K) \mathbb{P}(S_t > K) + e^{-rt} K \mathbb{P}(S_t > K) \\&\quad \vdots\end{aligned}$$

Similar for put.
