Definition 18.2-1 A random variable Y is *lognormally distributed* with parameters μ and $\sigma > 0$ if $\ln(Y) \sim N(\mu, \sigma^2)$.

²Image from Wikipedia.

Theorem 18.2-1 If Y_1 and Y_2 are lognormally distributed, so is $Y_1 Y_2$.

Proof.

Since Y_1 and Y_2 are lognormally distributed, $\ln(Y_1)$ and $\ln(Y_2)$ are normally distributed. Hence,

$$\ln(Y_1) + \ln(Y_2) = \ln(Y_1 Y_2)$$

is normally distributed too. Therefore, $Y_1 Y_2$ is lognormally distributed. \square

Theorem 18.2-2 If $\ln(Y) \sim N(\mu, \sigma^2)$, then the density of Y is given by

$$f_Y(y) = \frac{1}{y\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{\ln(y)-\mu}{\sigma}\right)^2}.$$

Proof. For $y > 0$,

$$\begin{aligned}\mathbb{P}(Y \leq y) &= \mathbb{P}(\ln(Y) \leq \ln(y)) \\ &= \mathbb{P}\left(\frac{\ln(Y) - \mu}{\sigma} \leq \frac{\ln(y) - \mu}{\sigma}\right) \\ &= \Phi\left(\frac{\ln(y) - \mu}{\sigma}\right).\end{aligned}$$

Hence,

$$\begin{aligned}f_Y(y) &= \frac{d}{dy} \Phi\left(\frac{\ln(y) - \mu}{\sigma}\right) \\ &= \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{\ln(y)-\mu}{\sigma}\right)^2} \frac{d}{dy} \frac{\ln(y) - \mu}{\sigma} \\ &= \frac{1}{y\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{\ln(y)-\mu}{\sigma}\right)^2}.\end{aligned}$$

□

Recall that the moment generating function of the normal random variable $X \sim N(\mu, \sigma^2)$ is

$$\mathbb{E} \left(e^{tX} \right) = e^{\mu t + \sigma^2 t^2 / 2}, \quad \text{for all } t \in \mathbb{R}. \quad (1)$$

Remark 18.2-1 If Y is lognormally distributed with parameters μ and σ , then

$$\mathbb{E} \left(Y^t \right) = e^{\mu t + \sigma^2 t^2 / 2}, \quad \text{for all } t \in \mathbb{R}.$$

Remark 18.2-2 By *Jensen's inequality*, if g is a convex function, then

$$\mathbb{E} (g(X)) \leq g(\mathbb{E}(X)).$$

Hence, for $g(x) = e^x$, we see that

$$\mathbb{E} \left(e^X \right) \leq e^{\mathbb{E}(X)}.$$

This is consistent with our computations above because

$$LHS = e^{\mu + \sigma^2 / 2} \geq e^{\mu} = RHS.$$

Theorem 18.2-3 If Y is lognormally distributed such that $\ln(Y) \sim N(\mu, \sigma^2)$, then

$$\mathbb{E}(Y) = e^{\mu + \frac{1}{2}\sigma^2} \quad \text{and} \quad \text{Var}(Y) = e^{2\mu + 2\sigma^2} (e^{\sigma^2} - 1).$$

Proof. Let $X = \ln(Y)$. By (1),

$$\mathbb{E}(Y) = \mathbb{E}(e^X) = e^{\mu + \frac{1}{2}\sigma^2}$$

and

$$\mathbb{E}(Y^2) = \mathbb{E}(e^{2X}) = e^{2\mu + 2\sigma^2}.$$

Therefore,

$$\text{Var}(Y) = \mathbb{E}(Y^2) - \mathbb{E}(Y)^2 = e^{2\mu + 2\sigma^2} - e^{2(\mu + \frac{1}{2}\sigma^2)} = e^{2\mu + 2\sigma^2} (e^{\sigma^2} - 1).$$
