Chapter 18. The Lognormal Distribution

1

Chapter 18. The Lognormal Distribution

- § 18.1 The normal distribution
- § 18.2 The lognormal distribution
- § 18.3 A lognormal model of stock prices
- § 18.4 Lognormal probability calculations
- § 18.5 Problems

Chapter 18. The Lognormal Distribution

- § 18.1 The normal distribution
- § 18.2 The lognormal distribution
- § 18.3 A lognormal model of stock prices
- § 18.4 Lognormal probability calculations
- § 18.5 Problem

Theorem 18.4-1

$$\mathbb{P}\left(\mathcal{S}_{t} < \mathcal{K}\right) = \mathcal{N}\left(-d_{2}\right) \quad \text{with} \quad d_{2} = \frac{\ln(\mathcal{S}/\mathcal{K}) + (r - \delta - \frac{1}{2}\sigma^{2})T}{\sigma\sqrt{T}}.$$

Or equivalently, $\mathbb{P}(S_t > d_2) = N(d_2)$.

Theorem 18.4-2 The $(1 - p) \times 100\%$ prediction interval for S_t is (S_t^L, S_t^U) with

$$\mathcal{S}_t^{L} = \mathcal{S}_0 e^{\left(lpha - \delta - rac{1}{2}\sigma^2
ight)t + \sigma\sqrt{t}\,N^{-1}(
ho/2)}$$

$$\mathbf{S}_t^U = \mathbf{S}_0 \mathbf{e}^{\left(\alpha - \delta - rac{1}{2}\sigma^2
ight)t + \sigma\sqrt{t}\,N^{-1}(1-p/2)}$$

Go over Examples 18.6 and 18.7 on P. 558-559.

Theorem 18.4-3 It holds that

$$\mathbb{E}\left(S_{t}|S_{t}<\mathcal{K}\right)=S_{0}e^{(\alpha-\delta)t}\frac{N\left(-d_{1}\right)}{N\left(-d_{2}\right)}$$

$$\mathbb{E}\left(S_{t}|S_{t}>\mathcal{K}\right)=S_{0}e^{(\alpha-\delta)t}\frac{N\left(+d_{1}\right)}{N\left(+d_{2}\right)}$$

where recall that

$$d_1 = \frac{\ln(S/K) + (r - \delta + \frac{1}{2}\sigma^2)T}{\sigma\sqrt{T}} \quad \text{and} \quad d_2 = \frac{\ln(S/K) + (r - \delta - \frac{1}{2}\sigma^2)T}{\sigma\sqrt{T}}$$

33

Now we are ready to derive the Black-Scholes formula:

$$C(S, K, \sigma, r, t, \delta) = e^{-rt} \mathbb{E} \left([S_t - K] \, \mathbb{1}_{\{S_t > K\}} \right)$$

$$= e^{-rt} \mathbb{E} \left([S_t - K] \, | S_t > K \right) \mathbb{P}(S_t > K)$$

$$= e^{-rt} \mathbb{E} \left(S_t | S_t > K \right) \mathbb{P}(S_t > K) + e^{-rt} \mathbb{E} \left(K | S_t > K \right) \mathbb{P}(S_t > K)$$

$$= e^{-rt} \mathbb{E} \left(S_t | S_t > K \right) \mathbb{P}(S_t > K) + e^{-rt} K \mathbb{P}(S_t > K)$$

$$\vdots$$

Similar for put.
